                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               459
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GENORICS 23:125-131 (1994).

-!- FUNCTION: MAJOR STRUCTURAL PROTEIN OF TISSUES SUCH AS AORTA AND
-!- FUNCTION: MAJOR STRUCTURAL PROTEIN CAPIDLY AND RECOVER COMPLETELY.
-!- SUBUNIT: THE POLYMERIC ELASTIN CHAINS ARE CROSS-LINKED TOGETHER
INTO AN EXTENSIBLE 3D NETWORK.
-!- SUBCELLULAR LOCATION: EXTRACELLULAR MATRIX OF ELASTIC FIBERS.
-!- FUM: THE CROSSLINKS ARE MADE OF DEAMINATED LYS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GGIPGVGGPGIGGPGIVGGPGAVSPAAAAAAAAAA--YGARGGVGIPTYGVGAGGFPG

                                                                                                                                                                                                                                                                                    The sequence represents Mycobacterium fusion protein antigen TbF14 consisting of a His tag for purification, antigen MtB81 and antigen Mo2. Compositions comprising at least 2 heterologous antigens, as a fusion protein, and vectors expressing the fusion proteins are used as vaccines to prophylactically immunise mammals (especially humans) against infection by Mycobacteria. The compositions contain at least 2 heterologous antigens that increase the serological sensitivity of individuals infected with tuberculosis, a disease frequently affecting patients with acquired immunodeficiency disease, AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

Novel Mycobacterium tuberculosis polypeptide comprising an immunogenic portion of M. tuberculosis antigens Mtb-81 and Mtb-67.2, useful for diagnosis, treatment and monitoring therapy of tuberculosis Polypeptides comprising an immunogenic portion of Mycobacterium tuberculosis antigens Mtb-81 or Mtb-67.2 or variants that differ by substitutions, additions, insertions and/or deletions but which still react with antigen specific antisera or T-cells are described. Also described are polynucleotides encoding the polypeptides. The polypeptides, expression vectors expressing the polypeptides or comprising an antisense polynucleotide, or an antigen presenting cell comprising a sequence encoding the polypeptides are useful for determining the presence or absence of M.tuberculosis in whole blood, serum, sputum, plasma, saliva, cerebrospinal fluid or urine in a patient infected with human immunodeficiency virus (HIV).

The present invention relates to a method for early detection of active mycobacterial disease or infection comprises assaying a biological fluid sample for the presence of early antibodies specific for an 88-kDa Mycobacterium tuberculosis (Mt) protein or immune complexes consisting of an 88-kDa M. tuberculosis protein or immune complexes consisting of specific for the antigen. The method is useful for the early and rapid electric nof mycobacterial disease, particularly tuberculosis, in individuals at heightened risk of developing tuberculosis. This individuals include human immunodeficiency virus (HIV)-infected subjects or other immunocompromised individuals. The method is a rapid and inexpensive screening procedure for detecting mycobacterial disease. The present sequence is a Mt 88 kDa secreted protein early antigen, used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    128

AAR77501 is encoded by an approx. 3 kb BfrI-PvuI fragment contg. the aceB gene from Cornyeform glutuanicum (see AA705501). Nucleorides 1 to 574 can be isolated and used to regulate the expression of a protein-encoding structural gene placed downstream of it, after incorporation into a vector and transfer into a Cornyeform bacterium. Induction of protein expression occurs even when the culture medium contains carbon sources other than acetate.
                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of agene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium. Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium, according the region of gene derived from coryneform bacterium, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
